The first line of the input consists of an integer n.
The next line contains n space-separated integers contained in the array.
Output Format
Return the integer sum of the elements in the array.
Constraints
1 ≤ n ≤ 10
0 ≤ ar[i] ≤ 10^10
Sample Input
STDIN
Function
5
arr[] size n = 5
1000000001 1000000002 1000000003 1000000004 1000000005
arr[...]
Output
5000000015
Note:
The range of the 32-bit integer is (−2^31) to (2^31 − 1) or [−2147483648, 2147483647].
When we add several integer values, the resulting sum might exceed the above range.
You might need to use long int C/C++/Java to store such sums.

Given a time in 12-hour AM/PM format, convert it to military (24-hour) time.
Note: - 12:00:00AM on a 12-hour clock is 00:00:00 on a 24-hour clock.
- 12:00:00PM on a 12-hour clock is 12:00:00 on a 24-hour clock.
Example
s = '12:01:00PM'
Return '12:01:00'.
s = '12:01:00AM'
Return '00:01:00'.
Function Description
Complete the timeConversion function with the following parameter(s):
string s: a time in 12 hour format
Returns
string: the time in 24 hour format
Input Format
A single string s that represents a time in 12-hour clock format (i.e.: hh:mm:ssAM or hh:mm:ssPM).
Constraints
All input times are valid
Sample Input 0
Got it
Remind me later
Change
string timeConversion(string s) {
}
}
// Format hours with a leading zero if needed
string hour_str = (hours < 10 ? "0" : "") + to_string(hours);
return hour_str + minutes_seconds;
}
int main()
{
ofstrea
variable result
Type: string (aka basic_string<char>)
// In main
string result = timeConversion(s)
string
getline
string result = timeConversion(s);
fout << result << "\n";
fout.close();
return 0;
}
